3.2	Mark-Recapture Distance Sampling Analysis	51
3.3	Generalized Additive Model Analysis	3
3.4	Model Cross-Validation	3
3.5	Abundance Estimates for AMAPPS Study Area	4
3.6	Seasonal Prediction Maps	5
3.7	Offshore Energy Development Areas5	1
4 S	ei Whale (<i>Balaenoptera borealis</i>)5	3
4.1	Data Collection5	4
4.2	Mark-Recapture Distance Sampling Analysis5	6
4.3	Generalized Additive Model Analysis5	8
4.4	Model Cross-Validation5	8
4.5	Abundance Estimates for AMAPPS Study Area5	9
4.6	Seasonal Prediction Maps6	0
4.7	Offshore Energy Development Areas7	6
5 N	linke Whale (<i>Balaenoptera acutorostrata</i>)7	8
5.1	Data Collection7	9
5.2	Mark-Recapture Distance Sampling Analysis8	51

5.3	Generalized Additive Model Analysis	
5.4	Model Cross-Validation	
5.5	Abundance Estimates for AMAPPS Study Area	
5.6	Seasonal Prediction Maps	
5.7	Offshore Energy Development Areas	
6 Sp	erm Whale (Physeter macrocephalus)	
6.1	Data Collection	
6.2	Mark-Recapture Distance Sampling Analysis	
6.3	Generalized Additive Model Analysis	
6.4	Model Cross-Validation	
6.5	Abundance Estimates for AMAPPS Study Area	
6.6	Seasonal Prediction Maps	
6.7	Offshore Energy Development Areas	
7 Cu	ivier's Beaked Whale (<i>Ziphius cavirostris</i>)	
7.1	Data Collection	
7.2	Mark-Recapture Distance Sampling Analysis	
7.3	Generalized Additive Model Analysis	
7.4	Model Cross-Validation	
7.5	Abundance Estimates for AMAPPS Study Area	
7.6	Seasonal Prediction Maps	
7.7	Offshore Energy Development Areas	
8 So	werby's Beaked Whale (Mesoplodon bidens)	
8.1	Data Collection	
8.2	Mark-Recapture Distance Sampling Analysis	
8.3	Generalized Additive Model Analysis	
8.4	Model Cross-Validation	
8.5	Abundance Estimates for AMAPPS Study Area	
8.6	Seasonal Prediction Maps	
8.7	Offshore Energy Development Areas	
9 Un	identified Beaked Whales	
9.1	Data Collection	
9.2	Mark-Recapture Distance Sampling Analysis	
9.3	Generalized Additive Model Analysis	
9.4	Model Cross-Validation	
9.5	Abundance Estimates for AMAPPS Study Area	
9.6	Seasonal Prediction Maps	

9.7	Offshore Energy Development Areas	166
10 Pyg	my Sperm Whale or Dwarf Sperm Whale (<i>Kogia</i> spp.)	167
10.1	Data Collection	168
10.2	Mark-Recapture Distance Sampling Analysis	170
10.3	Generalized Additive Model Analysis	172
10.4	Model Cross-Validation	173
10.5	Abundance Estimates for AMAPPS Study Area	174
10.6	Seasonal Prediction Maps	175
10.7	Offshore Energy Development Areas	179
11 Sho	ort-finned Pilot Whale (Globicephala macrorhynchus)	180
11.1	Data Collection	181
11.2	Mark-Recapture Distance Sampling Analysis	
11.3	Generalized Additive Model Analysis	185
11.4	Model Cross-Validation	
11.5	Abundance Estimates for AMAPPS Study Area	187
11.6	Seasonal Prediction Maps	188
11.7	Offshore Energy Development Areas	204
12 Lon	ng-finned Pilot Whale (<i>Globicephala melas</i>)	206
12.1	Data Collection	207
12.2	Mark-Recapture Distance Sampling Analysis	209
12.3	Generalized Additive Model Analysis	211
12.4	Model Cross-Validation	212
12.5	Abundance Estimates for AMAPPS Study Area	213
12.6	Seasonal Prediction Maps	214
12.7	Offshore Energy Development Areas	230
13 Ris	so's Dolphin (<i>Grampus griseus</i>)	232
13.1	Data Collection	233
13.2	Mark-Recapture Distance Sampling Analysis	235
13.3	Generalized Additive Model Analysis	237
13.4	Model Cross-Validation	238
13.5	Abundance Estimates for AMAPPS Study Area	239
13.6	Seasonal Prediction Maps	240
13.7	Offshore Energy Development Areas	256
14 Atla	antic White-sided Dolphin (<i>Lagenorhynchus acutus</i>)	258
14.1	Data Collection	259
14.2	Mark-Recapture Distance Sampling Analysis	261

14.3	Generalized Additive Model Analysis	
14.4	Model Cross-Validation	264
14.5	Abundance Estimates for AMAPPS Study Area	
14.6	Seasonal Prediction Maps	
14.7	Offshore Energy Development Areas	
15 Cor	mmon dolphin (<i>Delphinus delphis</i>)	284
15.1	Data Collection	
15.2	Mark-Recapture Distance Sampling Analysis	287
15.3	Generalized Additive Model Analysis	289
15.4	Model Cross-Validation	
15.5	Abundance Estimates for AMAPPS Study Area	291
15.6	Seasonal Prediction Maps	292
15.7	Offshore Energy Development Areas	
16 Atla	antic Spotted Dolphin (Stenella frontalis)	310
16.1	Data Collection	311
16.2	Mark-Recapture Distance Sampling Analysis	
16.3	Generalized Additive Model Analysis	315
16.4	Model Cross-Validation	
16.5	Abundance Estimates for AMAPPS Study Area	317
16.6	Seasonal Prediction Maps	318
16.7	Offshore Energy Development Areas	
17 Stri	ped Dolphin (<i>Stenella coeruleoalba</i>)	
17.1	Data Collection	
17.2	Mark-Recapture Distance Sampling Analysis	
17.3	Generalized Additive Model Analysis	
17.4	Model Cross-Validation	
17.5	Abundance Estimates for AMAPPS Study Area	
17.6	Seasonal Prediction Maps	
17.7	Offshore Energy Development Areas	
18 Cor	nmon Bottlenose Dolphin (<i>Tursiops truncatus</i>)	
18.1	Data Collection	
18.2	Mark-Recapture Distance Sampling Analysis	
18.3	Generalized Additive Model Analysis	
18.4	Model Cross-Validation	
18.5	Abundance Estimates for AMAPPS Study Area	
18.6	Seasonal Prediction Maps	

18.7	Offshore Energy Development Areas	386
19 Har	bor Porpoise (<i>Phocoena phocoena</i>)	388
19.1	Data Collection	389
19.2	Mark-Recapture Distance Sampling Analysis	391
19.3	Generalized Additive Model Analysis	393
19.4	Model Cross-Validation	395
19.5	Abundance Estimates for AMAPPS Study Area	396
19.6	Seasonal Prediction Maps	397
19.7	Offshore Energy Development Areas	413
20 Refe	erences	415

---	------------------------------

2.2 Mark-Recapture Distance Sampling Analysis

Analysis Set	MR Model	MR Truncation (m)	DS Model	DS Truncation (m)	Key function	p(0)	p(0) CV	Chi- square p-value	K-S p- value	CvM p- value
SE–aerial group 4	distance * observer + sea state + glare	300	distance	LT43- 300	HR	0.86	0.18	0.98	0.96	0.95
NE–aerial group 3	distance + group size	1500	distance + sea state + quality	1500	HR	0.67	0.09	0.06	0.87	0.94
NE– shipboard group 8	distance + time of day	7000	distance + glare	7000	HR	0.39	0.24	0.31	0.98	0.99
SE– shipboard group 5	distance * observer + group size	6000	distance + glare + time of day	6000	HR	0.57	0.11	0.24	0.61	0.65

Table 2-2 Intermediate parameters in humpback whale mark-recapture distance sampling models

MR=Mark-Recapture, DS=Distance Sampling, HR=Hazard Rate, HN= Half Normal, LT= Left truncation (in m), CV=Coefficient of variation. Values of p>0.5 for Chisquare, Kolmogorov-Smirnov test (K-S) and Cramer-von Mises test (CvM) indicate good fit. The definition of p(0) is the probability of detecting a group on the track line. Species included in the analysis sets are explained in main text Tables 6-5 to 6-8.

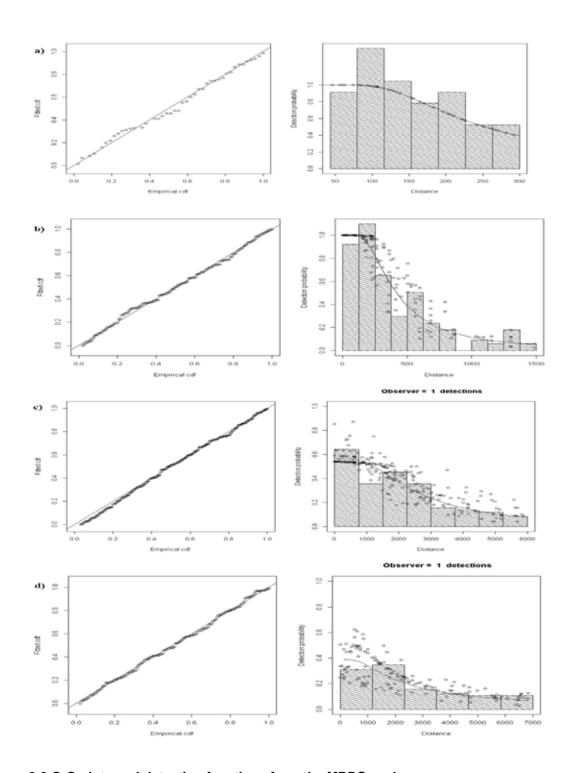

Figure 2-3 Q-Q plots and detection functions from the MRDS analyses a) SE-aerial analysis set 4; b) NE-aerial analysis set 3; c) NE-shipboard analysis set 8; d) SE-shipboard analysis set 5.

2.3 Generalized Additive Model Analysis

Covariates	Edf	Ref.df	F	C.dev	p-value

2.6 Seasonal Prediction Maps

Figure 2-6 Humpback whale spring average density estimates

Densities are for grid cells of 10 km x 10 km with the exception of the coastal region. Circles indicate locations of animal sightings. Light gray lines indicate the 100, 1,000 and 2,000 m depth contours. Blue polygons indicate locations of wind-energy study areas. Light green region indicates the region within the AMAPPS study area where we assumed the density was 0.

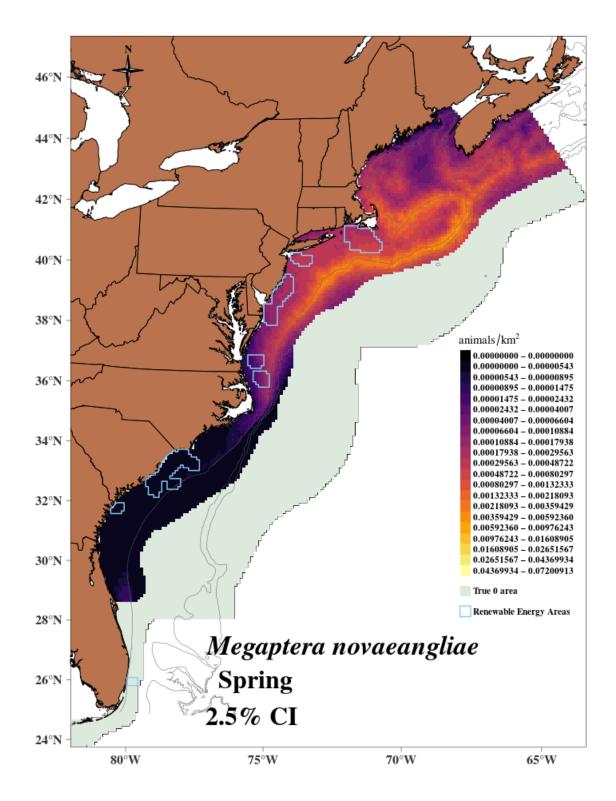

Figure 2-7 Lower 2.5% confidence interval of the spring humpback whale density estimates Densities are for grid cells of 10 km x 10 km with the exception of the coastal region. Light gray lines indicate the 100, 1,000 and 2,000 m depth contours. Blue polygons indicate locations of wind-energy study areas. Light green region indicates the region within the AMAPPS study area where we assumed the density was 0.

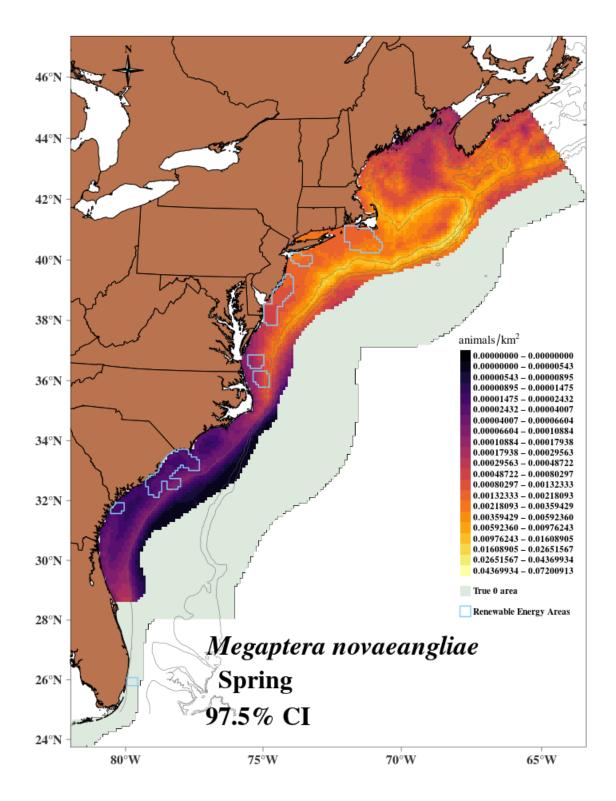

Figure 2-8 Upper 97.5% confidence interval of the spring humpback whale density estimates Densities are for grid cells of 10 km x 10 km with the exception of the coastal region. Light gray lines indicate the 100, 1,000 and 2,000 m depth contours. Blue polygons indicate locations of wind-energy study areas. Light green region indicates the region within the AMAPPS study area where we assumed the density was 0.

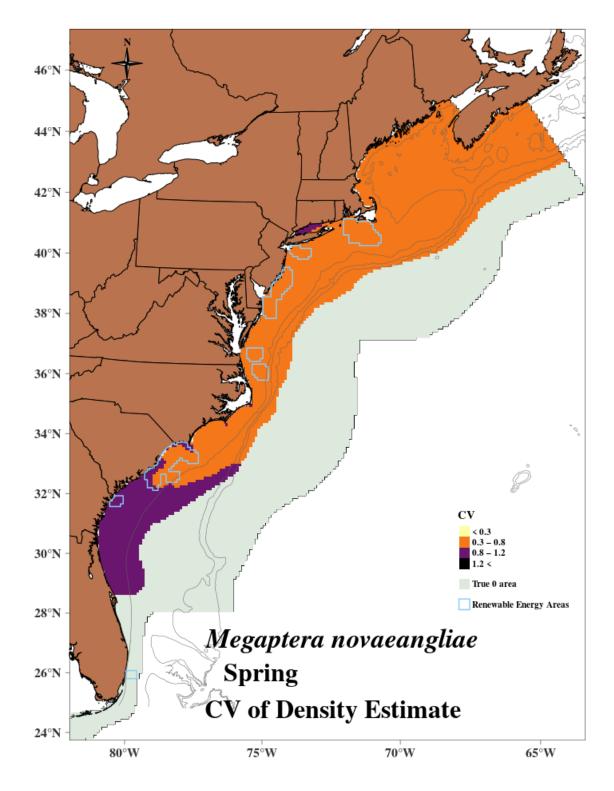

Figure 2-9 CV of spring humpback whale density estimates

CV's are for grid cells of 10 km x 10 km with the exception of the coastal region. Light gray lines indicate the 100, 1,000 and 2,000 m depth contours. Blue polygons indicate locations of wind-energy study areas. Light green region indicates the region within the AMAPPS study area where we assumed the density was 0.

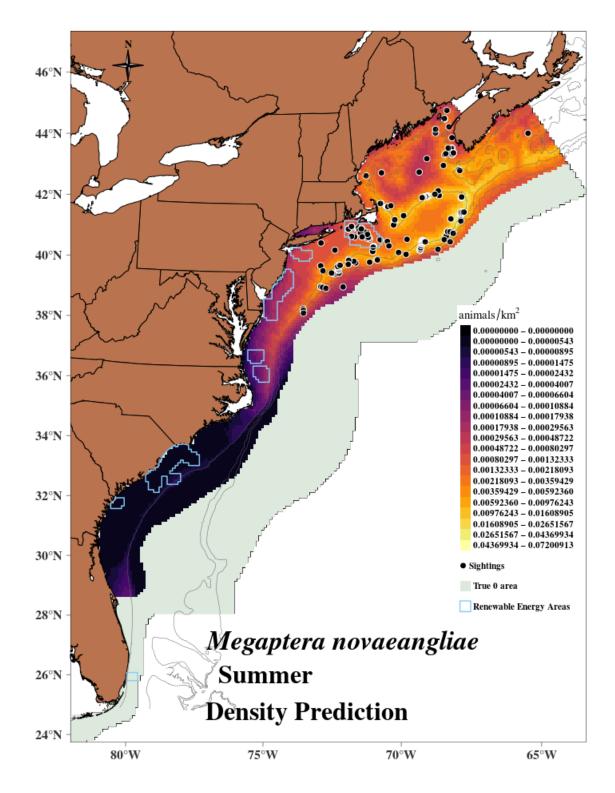

Figure 2-10 Humpback whale summer average density estimates

Densities are for grid cells of 10 km x 10 km with the exception of the coastal region. Circles indicate locations of animal sightings. Light gray lines indicate the 100, 1,000 and 2,000 m depth contours. Blue polygons indicate locations of wind-energy study areas. Light green region indicates the region within the AMAPPS study area where we assumed the density was 0.

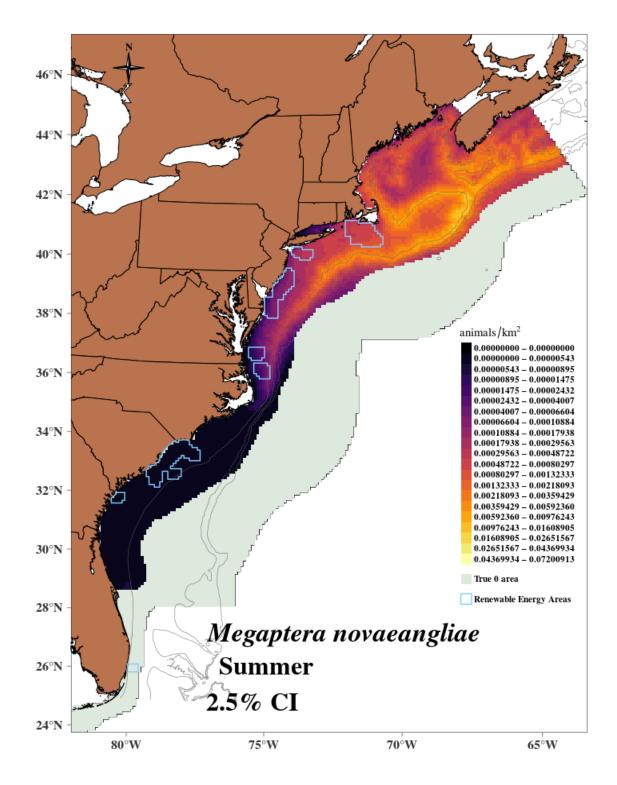

Figure 2-11 Lower 2.5% confidence interval of the summer humpback whale density estimates Densities are for grid cells of 10 km x 10 km with the exception of the coastal region. Light gray lines indicate the 100, 1,000 and 2,000 m depth contours. Blue polygons indicate locations of wind-energy study areas. Light green region indicates the region within the AMAPPS study area where we assumed the density was 0.

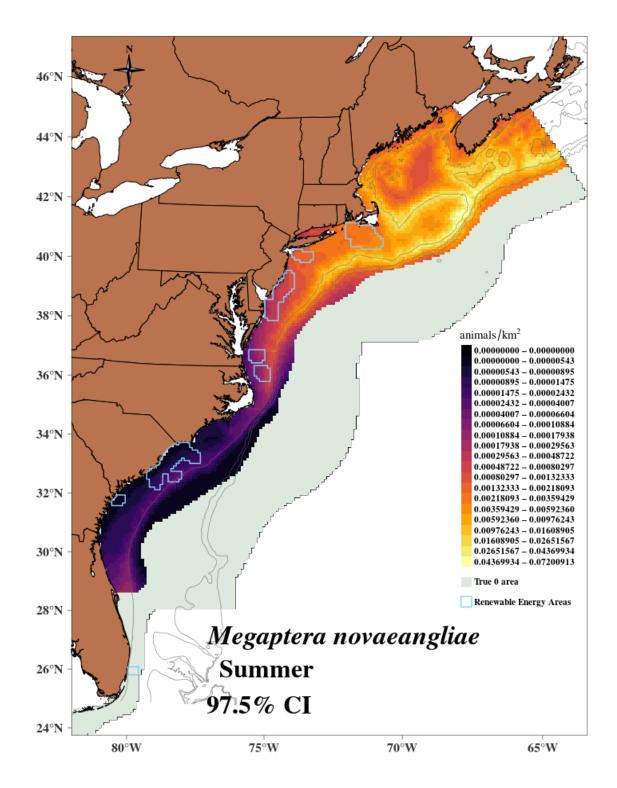

Figure 2-12 Upper 97.5% confidence interval of the summer humpback whale density estimates Densities are for grid cells of 10 km x 10 km with the exception of the coastal region. Light gray lines indicate the 100, 1,000 and 2,000 m depth contours. Blue polygons indicate locations of wind-energy study areas. Light green region indicates the region within the AMAPPS study area where we assumed the density was 0.

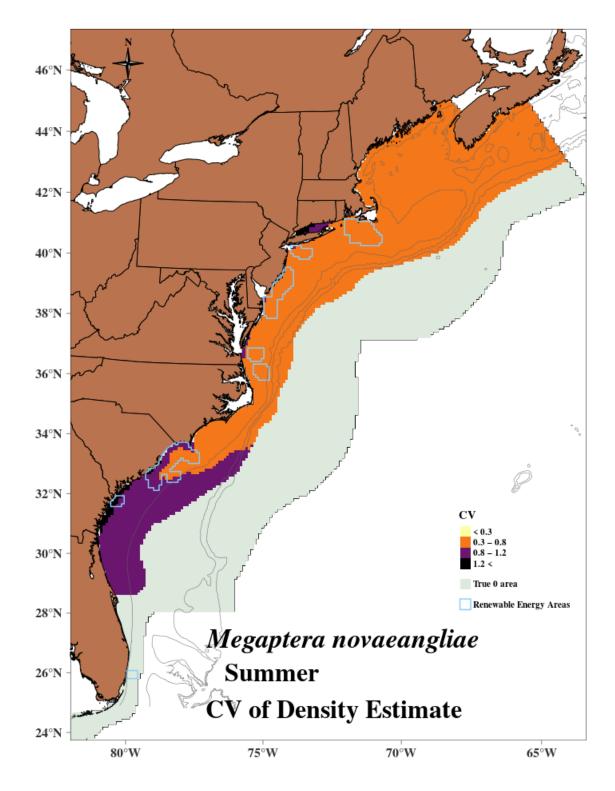

Figure 2-13 CV of summer humpback whale density estimates

CV's are for grid cells of 10 km x 10 km with the exception of the coastal region. Circles indicate locations of animal sightings. Light gray lines indicate the 100, 1,000 and 2,000 m depth contours. Blue polygons indicate locations of wind-energy study areas. Light green region indicates the region within the AMAPPS study area where we assumed the density was 0.

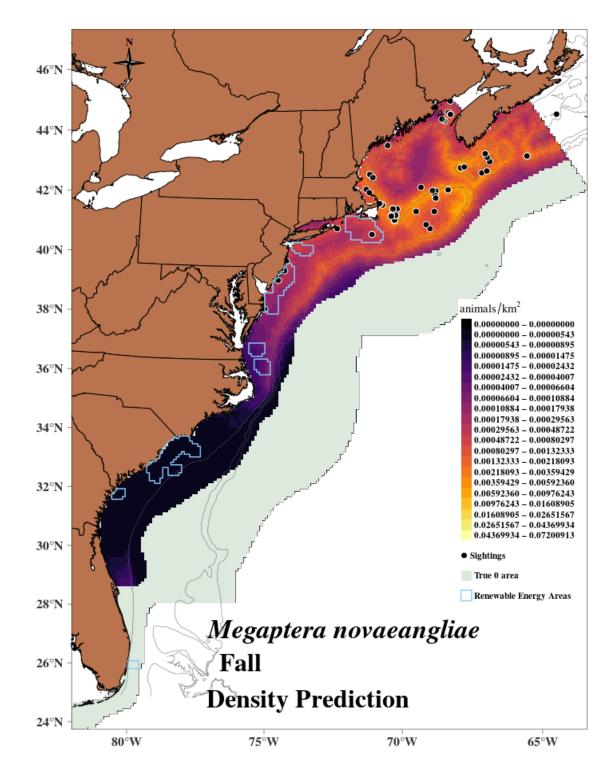

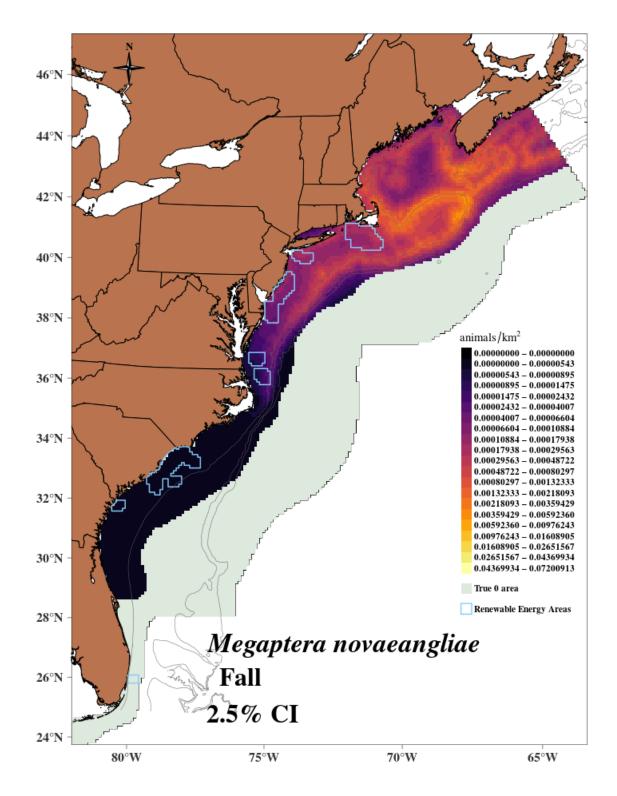

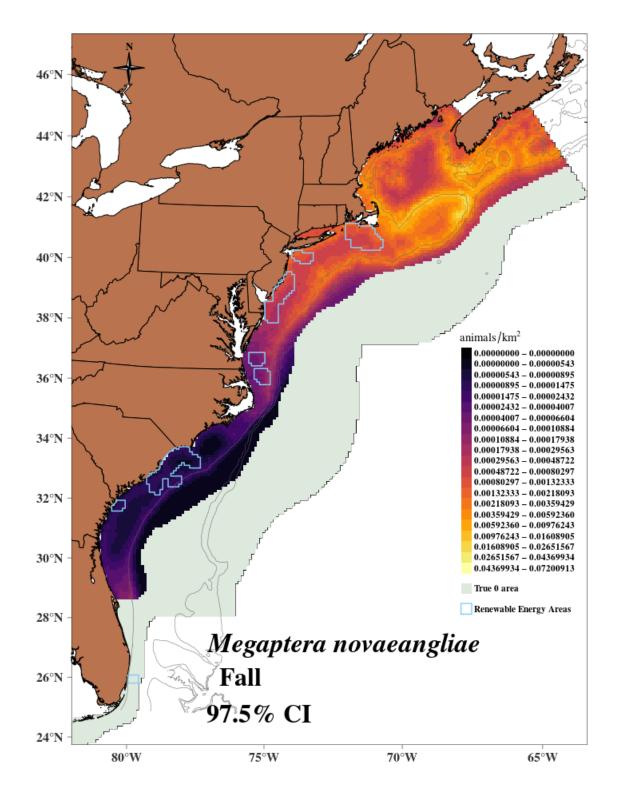

Figure 2-14 Humpback whale fall average density estimates

Densities are for grid cells of 10 km x 10 km with the exception of the coastal region. Circles indicate locations of animal sightings. Light gray lines indicate the 100, 1,000 and 2,000 m depth contours. Blue polygons indicate locations of wind-energy study areas. Light green region indicates the region within the AMAPPS study area where we assumed the density was 0.

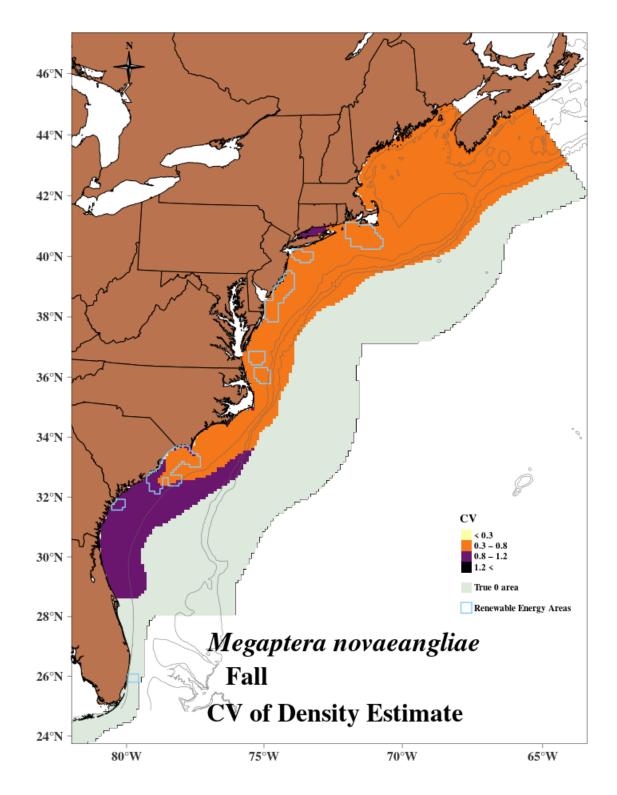

Figure 2-17 CV of fall humpback whale density estimates

CV's are for grid cells of 10 km x 10 km with the exception of the coastal region. Light gray lines indicate the 100, 1,000 and 2,000 m depth contours. Blue polygons indicate locations of wind-energy study areas. Light green region indicates the region within the AMAPPS study area where we assumed the density was 0.

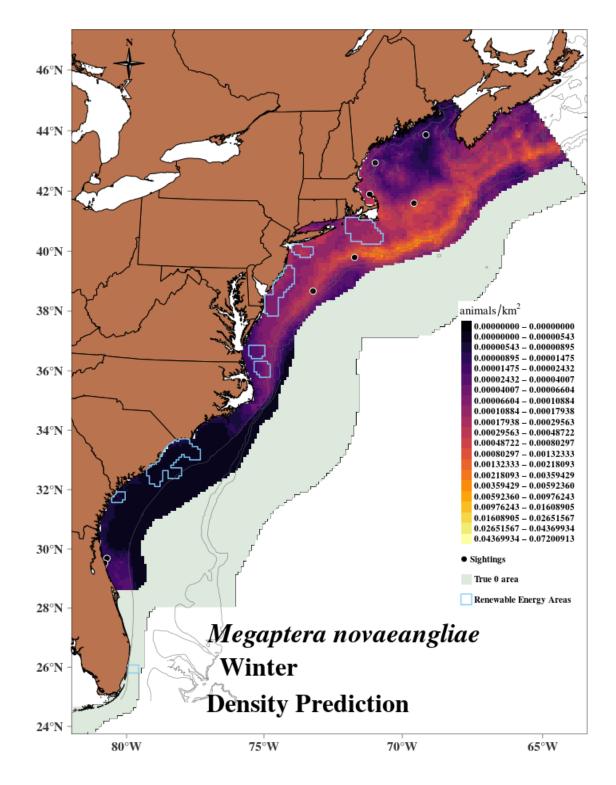

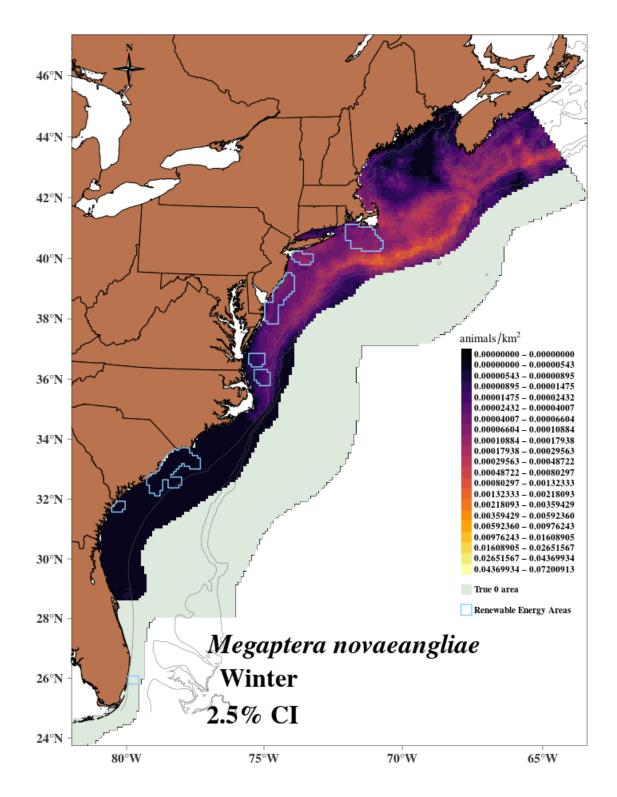

Figure 2-18 Humpback whale winter average density estimates

Densities are for grid cells of 10 km x 10 km with the exception of the coastal region. Circles indicate locations of animal sightings. Light gray lines indicate the 100, 1,000 and 2,000 m depth contours. Blue polygons indicate locations of wind-energy study areas. Light green region indicates the region within the AMAPPS study area where we assumed the density was 0.

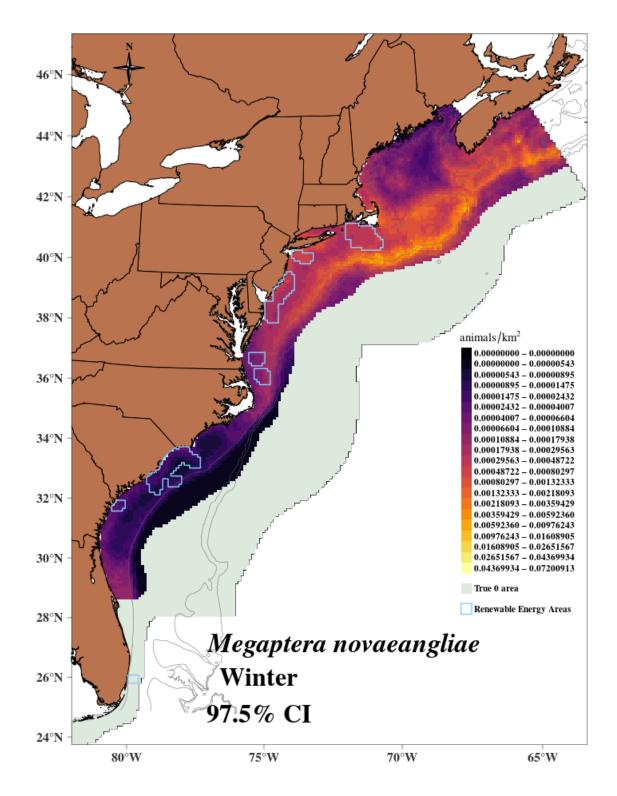

Figure 2-20 Upper 97.5% confidence interval of the winter humpback whale density estimates Densities are for grid cells of 10 km x 10 km with the exception of the coastal region. Light gray lines indicate the 100, 1,000 and 2,000 m depth contours. Blue polygons indicate locations of wind-energy study areas. Light green region indicates the region within the AMAPPS study area where we assumed the density was 0.

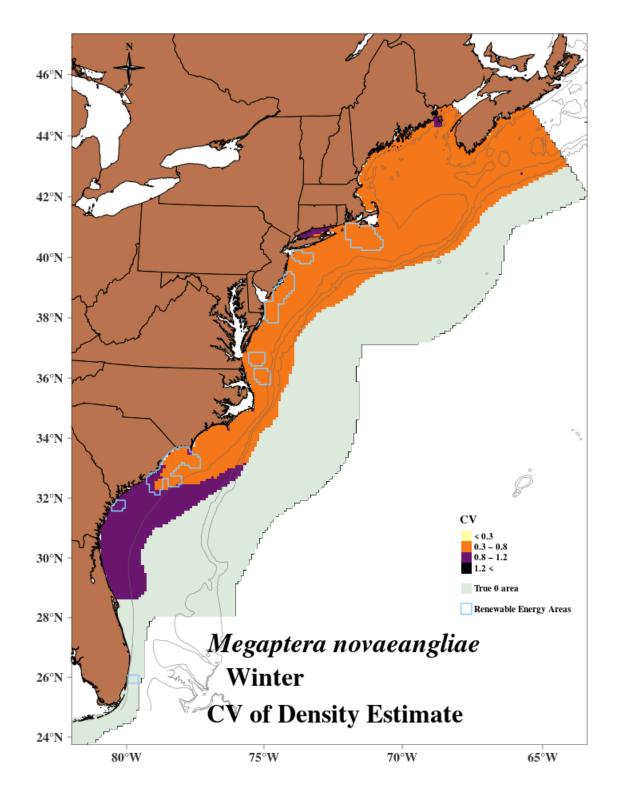

Figure 2-21 CV of winter humpback whale density estimates

CV's are for grid cells of 10 km x 10 km with the exception of the coastal region. Light gray lines indicate the 100, 1,000 and 2,000 m depth contours. Blue polygons indicate locations of wind-energy study areas. Light green region indicates the region within the AMAPPS study area where we assumed the density was 0.

	NC/SC	2.6	0.50	1.0–6.5

Table 2-6 Humpback whale abundance estimates for wind-energy study areas

* We rounded the mean abundance and 95% confidence interval to the nearest tenth of an animal. If this resulted in a zero for the mean abundance, we calculated the CV using the actual abundance value as estimated by the density-density-habitat model and then rounded to the nearest tenth. If a wind-energy study area is not included, then we assumed the abundance was zero.

Table 4-6 Sei whale abundance estimates for wind-energy study areas

* We rounded the mean abundance and 95% confidence interval to the nearest tenth of an animal. If this resulted in a zero for the mean abundance, we calculated the CV using the actual abundance value as estimated by the density-habitat model and then rounded to the nearest tenth. If a wind-energy study area is not included, then we assumed the abundance was zero.

Table 6-6 Sperm whale abundance estimates for wind-energy study areas

* We rounded the mean abundance and 95% confidence interval to the nearest tenth of an animal. If this resulted in a zero for the mean abundance, we calculated the CV using the actual abundance value as estimated by the density-habitat model and then rounded to the nearest tenth. If a wind-energy study area is not included, then we assumed the abundance was zero.

10.6 Seasonal Prediction Maps

Figure 10-6 Kogia spp. summer average density estimates

Densities are for grid cells of 10 km x 10 km with the exception of the coastal region. Black circles indicate locations of animal sightings. White circles indicate locations of passive acoustic detections of *Kogia* spp. from the NEFSC and SEFSC 2016 and 2018 towed hydrophone arrays. Light gray lines indicate the 100, 1,000 and 2,000 m depth contours. Blue polygons indicate locations of wind-energy study areas. Light green region indicates the region within the AMAPPS study area where we assumed the density was 0.

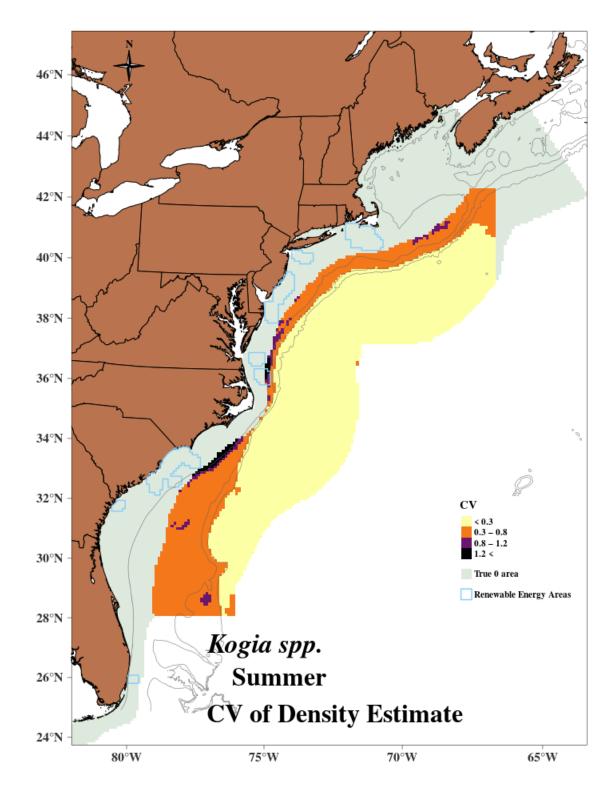

Figure 10-9 CV of summer Kogia spp. density estimates

CVs are for grid cells of 10 km x 10 km with the exception of the coastal region. Light gray lines indicate the 100, 1,000 and 2,000 m depth contours. Blue polygons indicate locations of wind-energy study areas. Light green region indicates the region within the AMAPPS study area where we assumed the density was 0.

10.7 Offshore Energy Development Areas

Table 10-6 Kogia spp. abundance estimates for wind-energy study areas

Season	Wind-Energy Study Area	Abundance*	CV	95% Confidence Interval*
Summer (Jun – Aug)	NC	0.0	1.06	0.0-0.2

* We rounded the mean abundance and 95% confidence interval to the nearest tenth of an animal. If this resulted in a zero for the mean abundance, we calculated the CV using the actual abundance value as estimated by the density-habitat model and then rounded to the nearest tenth. If a wind-energy study area is not included, then we assumed the abundance was zero.

* We rounded the mean abundance and 95% confidence interval to the nearest tenth of an animal. If this resulted in a zero for the mean abundance, we calculated the CV using the actual abundance value as estimated by the density-habitat model and then rounded to the nearest tenth. If a wind-energy study area is not included, then we assumed the abundance was zero.

Table 14-6 Atlantic white-sided dolphin abundance estimates for wind-energy study areas

* We rounded the mean abundance and 95% confidence interval to the nearest tenth of an animal. If this resulted in a zero for the mean abundance, we calculated the CV using the actual abundance value as estimated by the density-habitat model and then rounded to the nearest tenth. If a wind-energy study area is not included, then we assumed the abundance was zero.

Table 17-6 Striped dolphin abundance estimates for wind-energy study areas

* We rounded the mean abundance and 95% confidence interval to the nearest tenth of an animal. If this resulted in a zero for the mean abundance, we calculated the CV using the actual abundance value as estimated by the density-habitat model and then rounded to the nearest tenth. If a wind-energy study area is not included, then we assumed the abundance was zero.

Table 19-3 2010 to 2017 density-habitat model output for harbor porpoises

Includes the estimated degrees of freedom (Edf), reference degrees of freedom (Ref.df), contribution to the deviance (C.dev) explained for each habitat covariate and its associated p-value. Covariate abbreviations explained in main text in Tables 6-1 and 6-2.

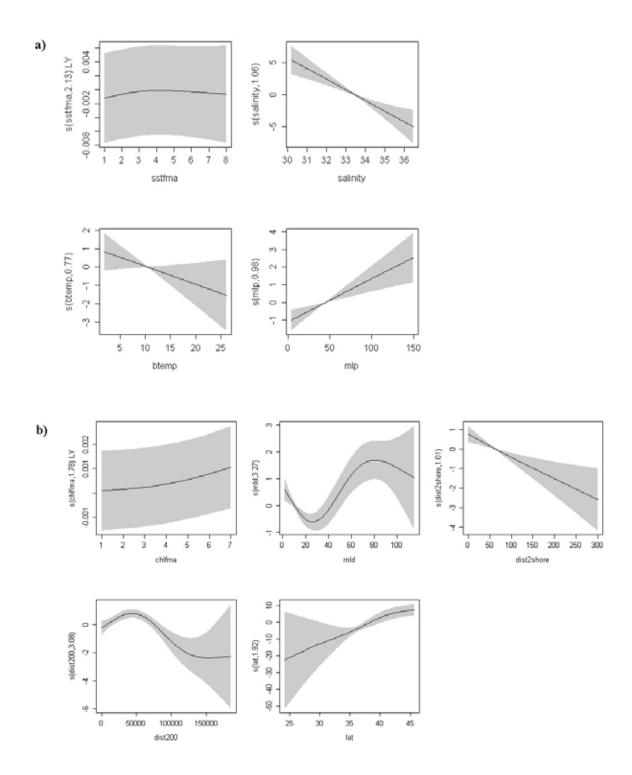

Figure 19-4 Harbor porpoise density relative to significant habitat covariates

Plots represent the partial smooths and interaction terms of the density-habitat model, where the shaded regions represent the 95% credible intervals. Covariate abbreviations explained in main text in Tables 6-1 and 6-2. Plots in (a) are from the November to May (spread out distribution) model, and (b) are from the June to October (compact distribution) model.

19.4 Model Cross-Validation

Table 19-4 Diagnostic statistics from the harbor porpoise density-habitat model

	Diagnostic Statistic	Description	Calculated with	Model Values (x)	Score
November	RHO	Spearman rank correlation	Non-zero density	0.318	Excellent
to May –	MAPE	Mean absolute percentage error	Non-zero density	94.432	Fair to good
spread out	RHO	Spearman rank correlation	All data divided in 25 random samples	0.157	Fair to good
distribution	MAE	Mean absolute error	All data divided in 25 random samples	0.143	Excellent
June to	RHO	Spearman rank correlation	Non-zero density	0.318	Excellent
October –	MAPE	Mean absolute percentage error	Non-zero density	81.184	Fair to good
compact	RHO	Spearman rank correlation	All data divided in 25 random samples	0.181	Fair to good
distribution	MAE	Mean absolute error	All data divided in 25 random samples	0.377	Fair to good

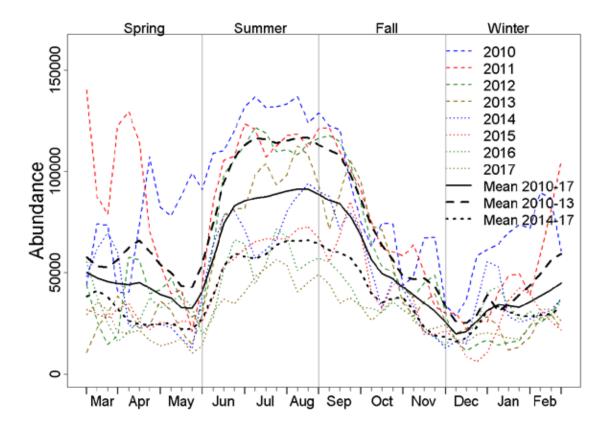

RHO: Poor= x<0.05; Fair to good =0.05<=x<0.3; Excellent= x>0.3

MAPE: Poor= x>150%; Fair to good= 150%>=x>50%; Excellent= x<=50% MAE: Poor= x>1; Fair to good = 1>=x>0.25; Excellent= x<=0.25

19.5 Abundance Estimates for AMAPPS Study Area

Season	Time Period	Average Abundance	CV	95% Confidence Interval
	2010–2013	54,660	0.66	16,820–177,632
Spring (March–May)	2014–2017	29,006	0.58	10,095–83,342
	2010–2017	41,813	0.63	13,464–129,850

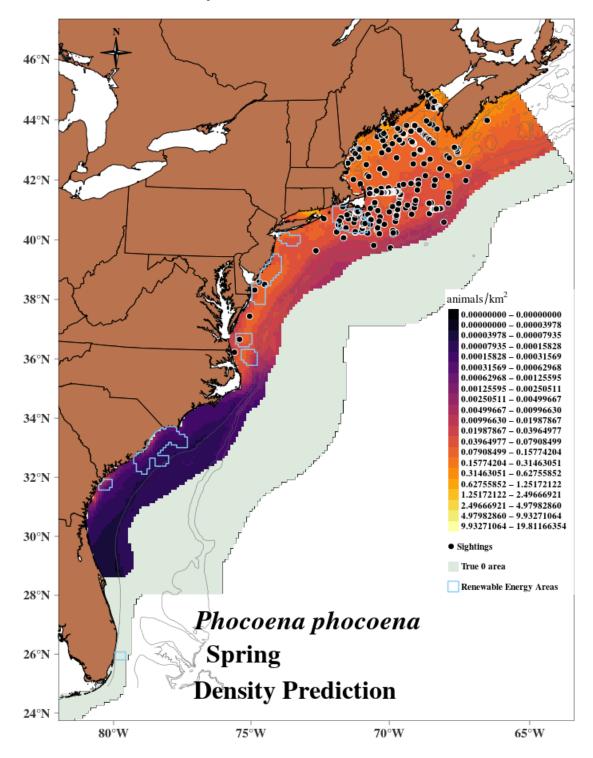

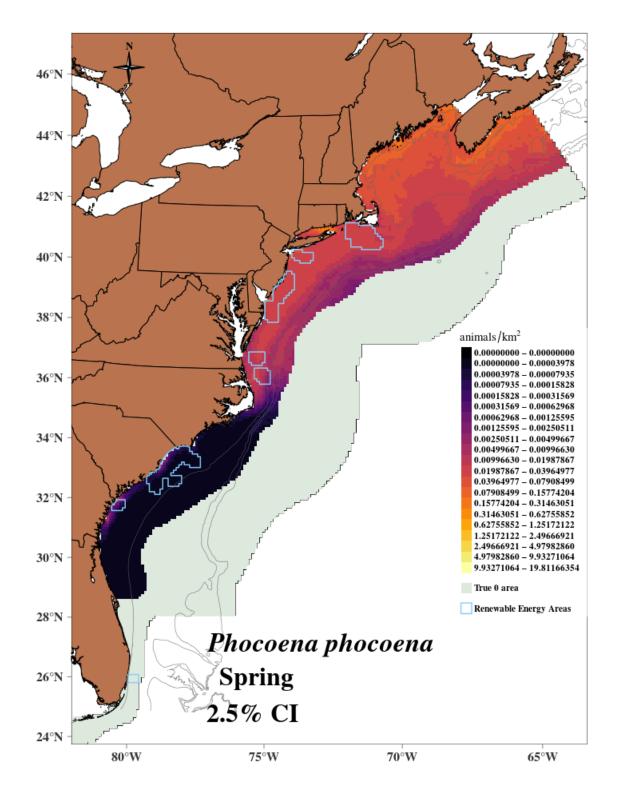

Figure 19-6 Harbor porpoise spring average density estimates

Densities are for grid cells of 10 km x 10 km with the exception of the coastal region. Circles indicate locations of animal sightings. Light gray lines indicate the 100, 1,000 and 2,000 m depth contours. Blue polygons indicate locations of wind-energy study areas. Light green region indicates the region within the AMAPPS study area where we assumed the density was 0.

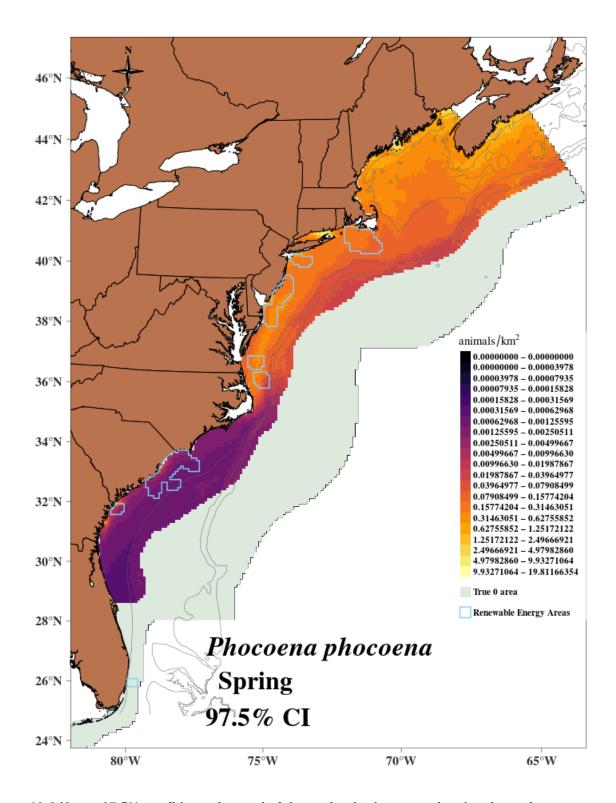

Figure 19-8 Upper 97.5% confidence interval of the spring harbor porpoise density estimates Densities are for grid cells of 10 km x 10 km with the exception of the coastal region. Light gray lines indicate the 100, 1,000 and 2,000 m depth contours. Blue polygons indicate locations of wind-energy study areas. Light green region indicates the region within the AMAPPS study area where we assumed the density was 0.

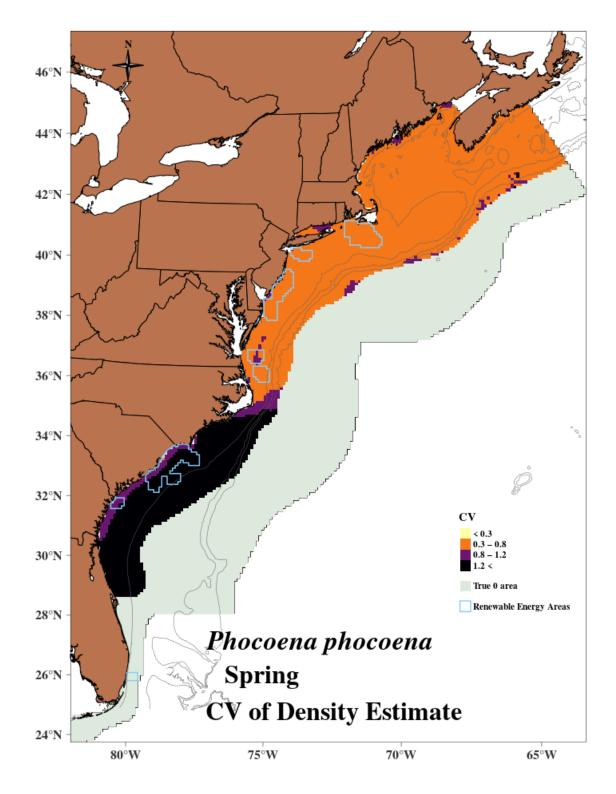

Figure 19-9 CV of spring harbor porpoise density estimates

CV's are for grid cells of 10 km x 10 km with the exception of the coastal region. Light gray lines indicate the 100, 1,000 and 2,000 m depth contours. Blue polygons indicate locations of wind-energy study areas. Light green region indicates the region within the AMAPPS study area where we assumed the density was 0.

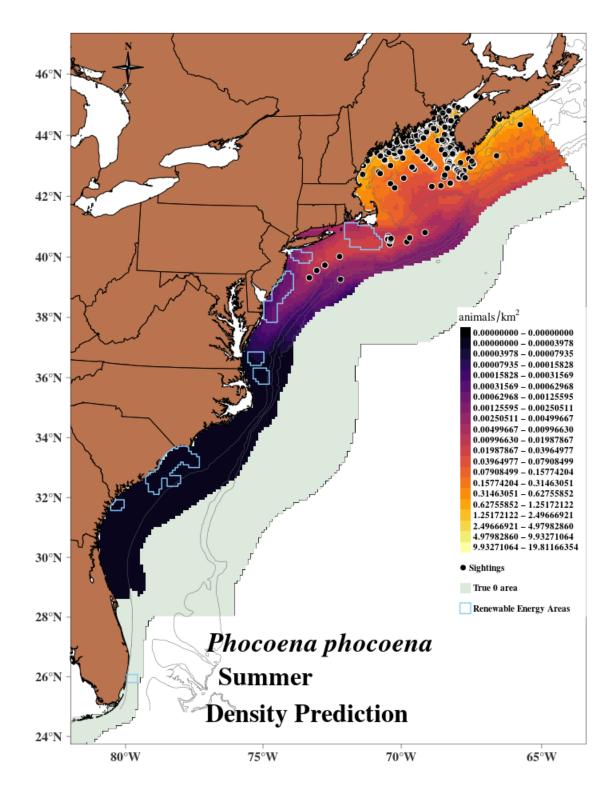

Figure 19-10 Harbor porpoise summer average density estimates

Densities are for grid cells of 10 km x 10 km with the exception of the coastal region. Circles indicate locations of animal sightings. Light gray lines indicate the 100, 1,000 and 2,000 m depth contours. Blue polygons indicate locations of wind-energy study areas. Light green region indicates the region within the AMAPPS study area where we assumed the density was 0.

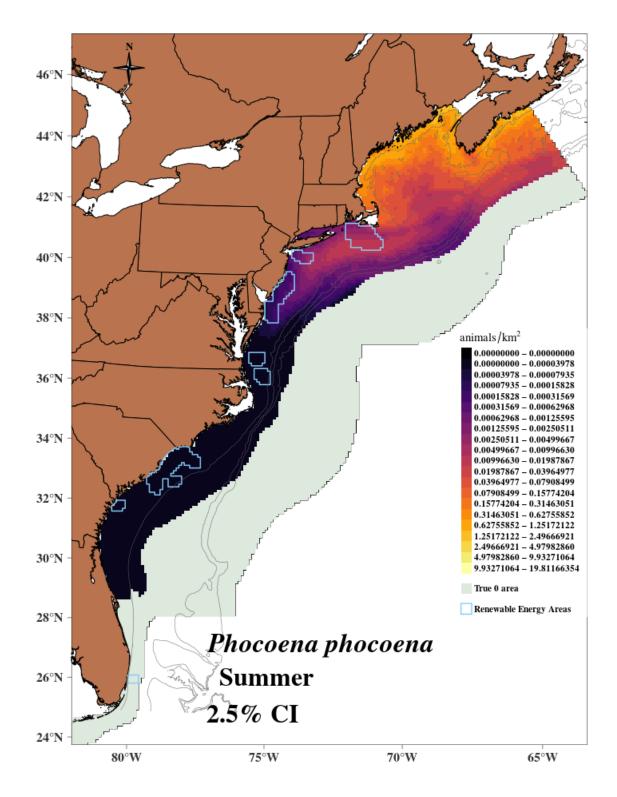

Figure 19-11 Lower 2.5% confidence interval of the summer harbor porpoise density estimates Densities are for grid cells of 10 km x 10 km with the exception of the coastal region. Light gray lines indicate the 100, 1,000 and 2,000 m depth contours. Blue polygons indicate locations of wind-energy study areas. Light green region indicates the region within the AMAPPS study area where we assumed the density was 0.

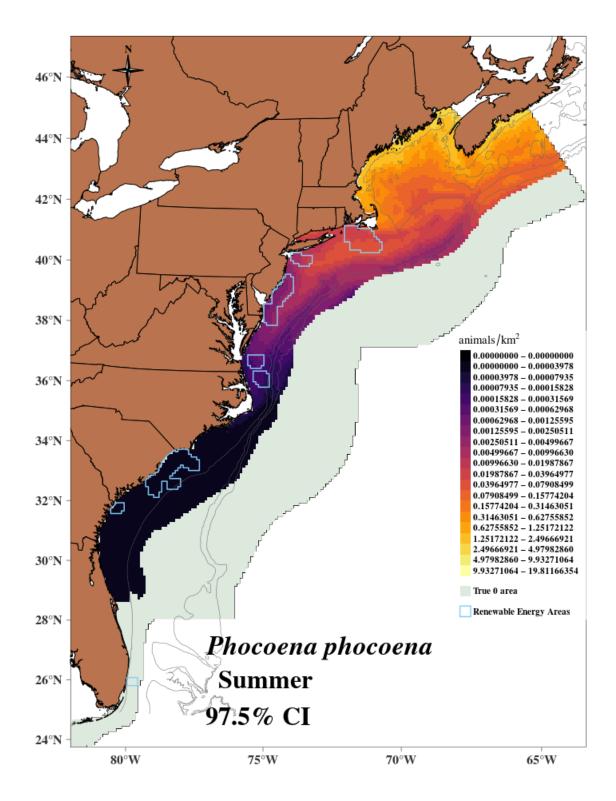

Figure 19-12 Upper 97.5% confidence interval of the summer harbor porpoise density estimates Densities are for grid cells of 10 km x 10 km with the exception of the coastal region. Light gray lines indicate the 100, 1,000 and 2,000 m depth contours. Blue polygons indicate locations of wind-energy study areas. Light green region indicates the region within the AMAPPS study area where we assumed the density was 0.

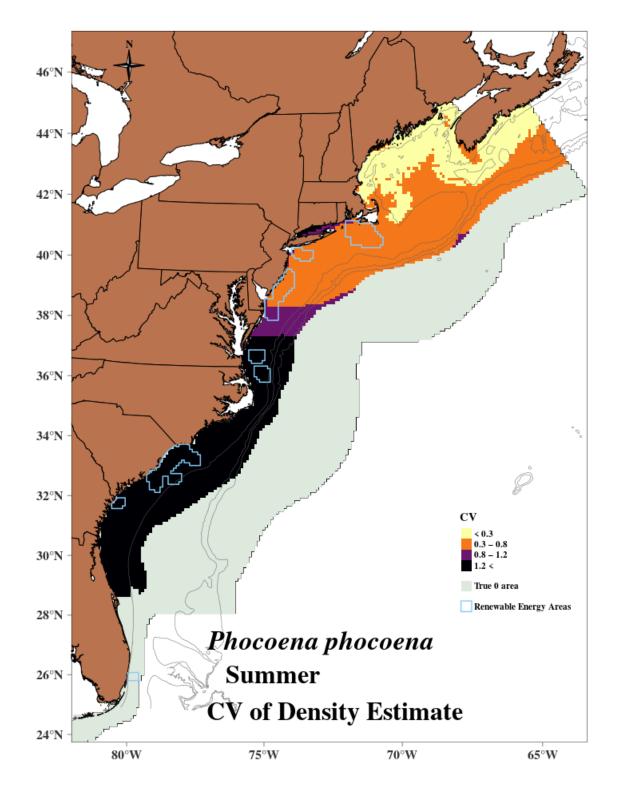

Figure 19-13 CV of summer harbor porpoise density estimates

CV's are for grid cells of 10 km x 10 km with the exception of the coastal region. Light gray lines indicate the 100, 1,000 and 2,000 m depth contours. Blue polygons indicate locations of wind-energy study areas. Light green region indicates the region within the AMAPPS study area where we assumed the density was 0.

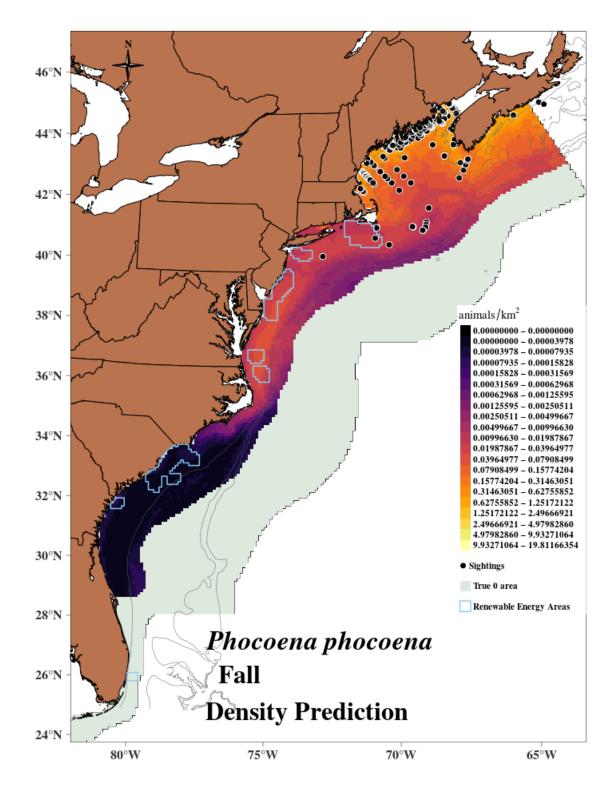

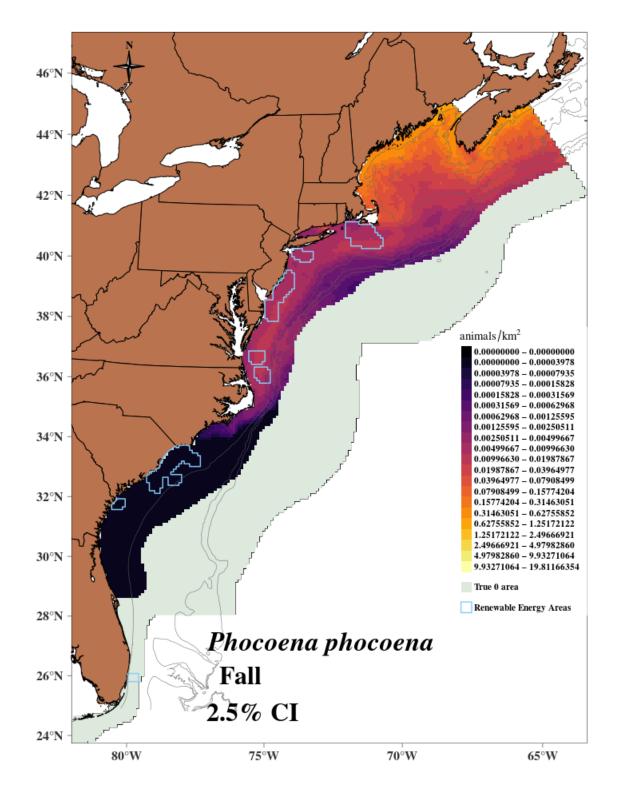

Figure 19-14 Harbor porpoise fall average density estimates

Densities are for grid cells of 10 km x 10 km with the exception of the coastal region. Circles indicate locations of animal sightings. Light gray lines indicate the 100, 1,000 and 2,000 m depth contours. Blue polygons indicate locations of wind-energy study areas. Light green region indicates the region within the AMAPPS study area where we assumed the density was 0.

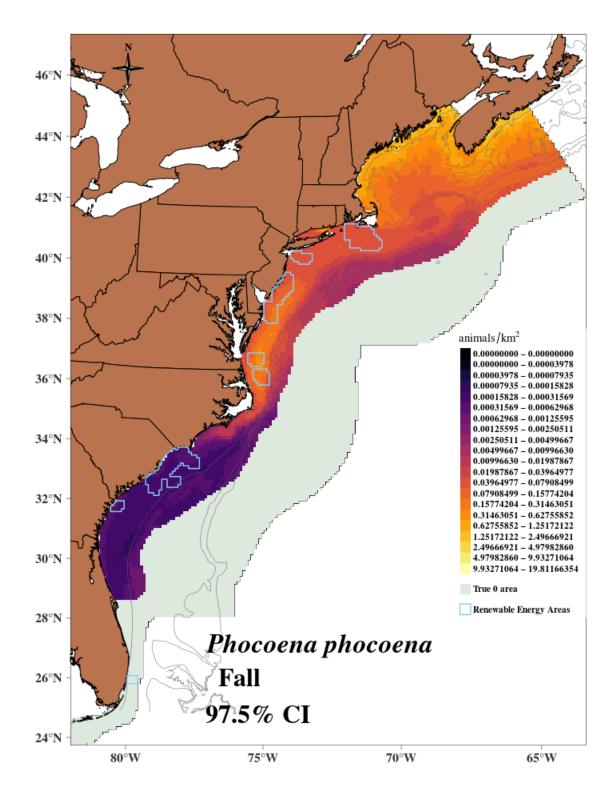

Figure 19-16 Upper 97.5% confidence interval of the fall harbor porpoise density estimates

Densities are for grid cells of 10 km x 10 km with the exception of the coastal region. Light gray lines indicate the 100, 1,000 and 2,000 m depth contours. Blue polygons indicate locations of wind-energy study areas. Light green region indicates the region within the AMAPPS study area where we assumed the density was 0.

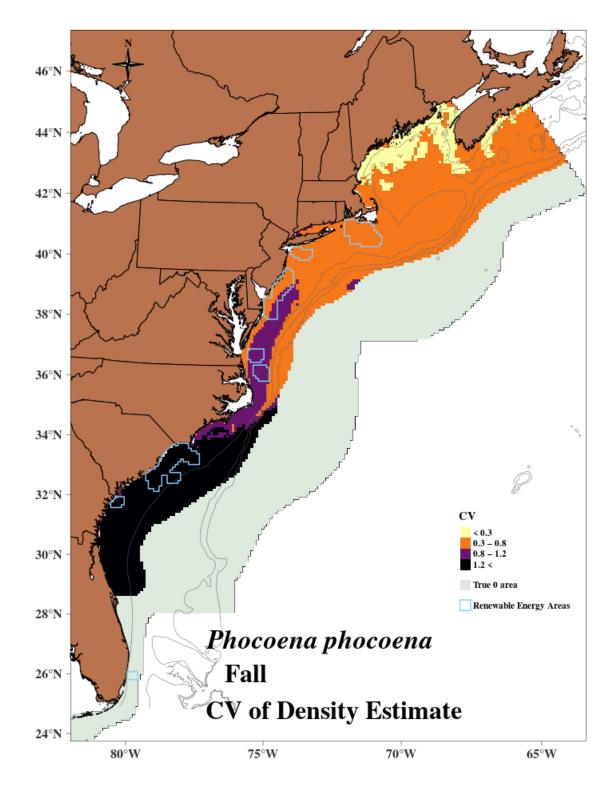

Figure 19-17 CV of fall harbor porpoise density estimates

CV's are for grid cells of 10 km x 10 km with the exception of the coastal region. Light gray lines indicate the 100, 1,000 and 2,000 m depth contours. Blue polygons indicate locations of wind-energy study areas. Light green region indicates the region within the AMAPPS study area where we assumed the density was 0.

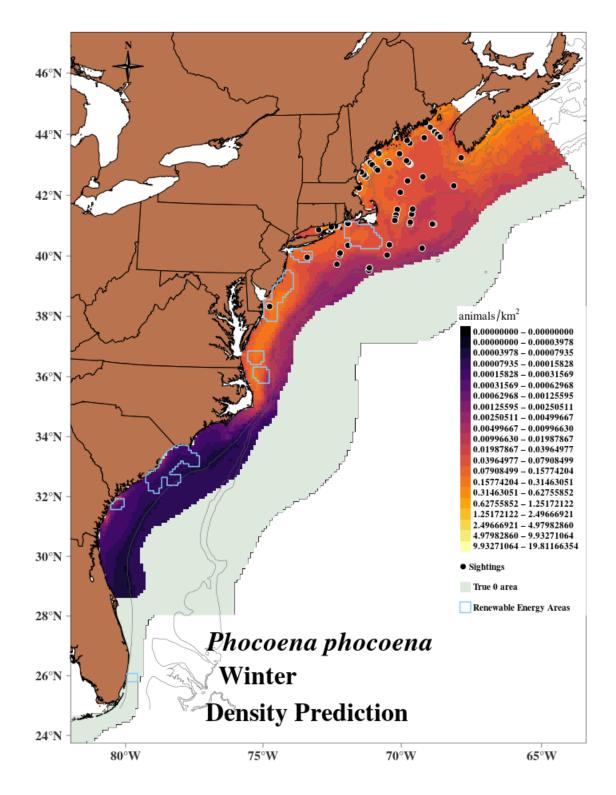

Figure 19-18 Harbor porpoise winter average density estimates

Densities are for grid cells of 10 km x 10 km with the exception of the coastal region. Circles indicate locations of animal sightings. Light gray lines indicate the 100, 1,000 and 2,000 m depth contours. Blue polygons indicate locations of wind-energy study areas. Light green region indicates the region within the AMAPPS study area where we assumed the density was 0.

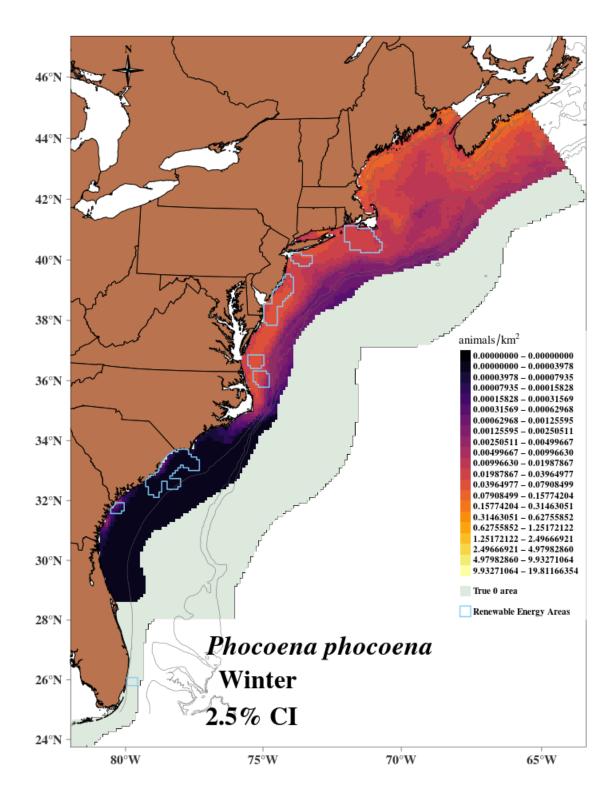

Figure 19-19 Lower 2.5% confidence interval of the winter harbor porpoise density estimates Densities are for grid cells of 10 km x 10 km with the exception of the coastal region. Light gray lines indicate the 100, 1,000 and 2,000 m depth contours. Blue polygons indicate locations of wind-energy study areas. Light green region indicates the region within the AMAPPS study area where we assumed the density was 0.

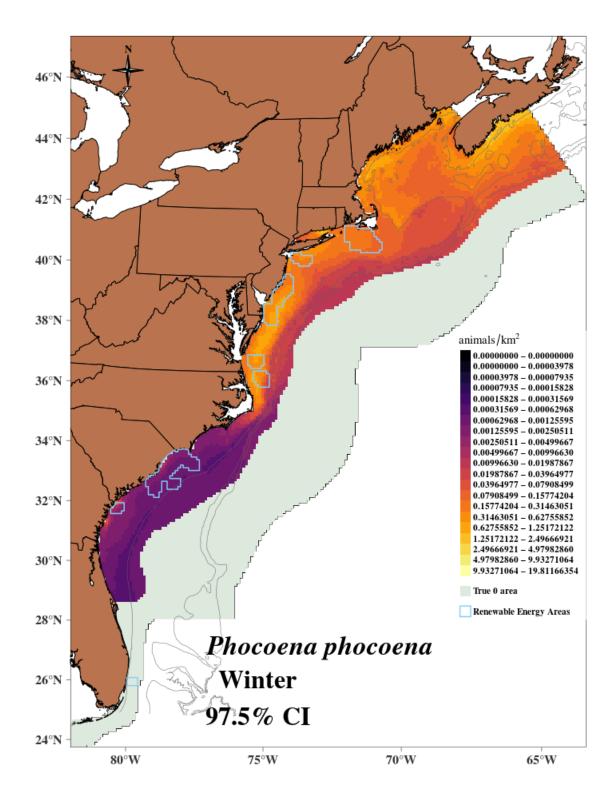

Figure 19-20 Upper 97.5% confidence interval of the winter harbor porpoise density estimates Densities are for grid cells of 10 km x 10 km with the exception of the coastal region. Light gray lines indicate the 100, 1,000 and 2,000 m depth contours. Blue polygons indicate locations of wind-energy study areas. Light green region indicates the region within the AMAPPS study area where we assumed the density was 0.

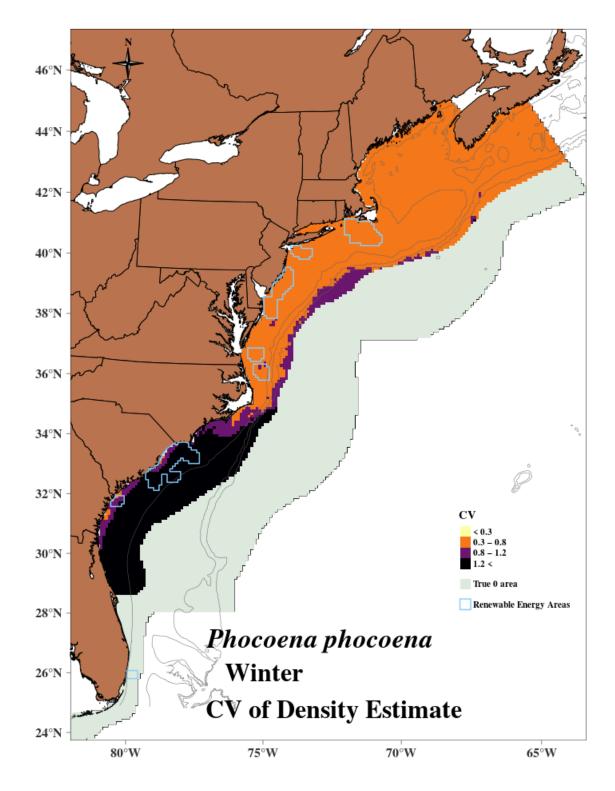

Figure 19-21 CV of winter harbor porpoise density estimates

CV's are for grid cells of 10 km x 10 km with the exception of the coastal region. Light gray lines indicate the 100, 1,000 and 2,000 m depth contours. Blue polygons indicate locations of wind-energy study areas. Light green region indicates the region within the AMAPPS study area where we assumed the density was 0.

19.7 Offshore Energy Development Areas

Season	Wind-Energy Study Area	Abundance*	CV	95% Confidence Interval*
Spring	RI/MA	837.0	0.52	321.3–2,180.1
(Mar–May)	NY	267.0	0.62	87.2-817.6
	NJ	641.6	0.68	190.6–2,160.0
	DE/MD	389.2	0.72	110.0–1,377.3
	VA	196.7	0.78	50.6-764.0
	NC	148.7	0.74	40.6–543.8
	NC/SC	7.5	1.03	1.4–39.7
Summer	RI/MA	256.8	0.41	118.1–558.3
(Jun–Aug)	NY	16.4	0.48	6.7–40.5
	NJ	6.1	0.66	1.9–19.7

	DE/MD	703.7	0.70	203.9–2,428.9
	VA	422.8	0.72	119.0–1,501.8
	NC	312.1	0.76	83.1–1,171.8
	NC/SC	3.9	1.13	0.7–23

Table 19-6 Harbor porpoise abundance estimates for wind-energy study areas

* We rounded the mean abundance and 95% confidence interval to the nearest tenth of an animal. If this resulted in a zero for the mean abundance, we calculated the CV using the actual abundance value as estimated by the density-habitat model and then rounded to the nearest tenth. If a wind-energy study area is not included, then we assumed the abundance was zero.

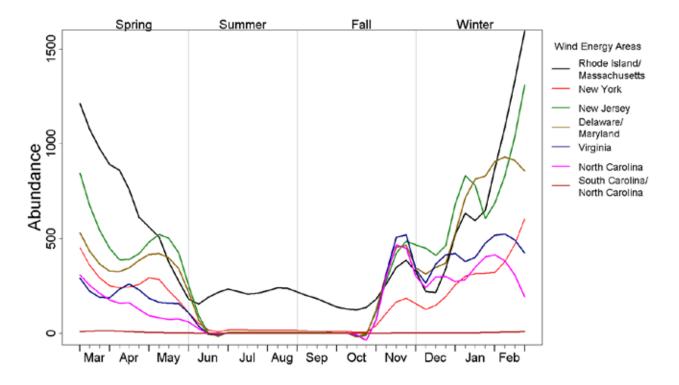

Figure 19-22 Average seasonal abundance of harbor porpoises in the wind-energy study areas
